ABSTRACT

A parking space payment method and system includes suitable payment means which enable the user to pay a given amount in order to use an authorised parking space for a corresponding length of time. The aforementioned payment means co-operate with suitable processing and communication means in order to provide the user with a specific transaction code. The payment means also cooperates with processing and input means which enable the user to enter the code from a previous transaction, such as to increase the authorised parking duration by any authorised time remaining from the time authorised during the earlier transaction.
